Material Report

COMPARISON OF COUPLING AGENTS EFFICIENCY IN GLASS FIBER REINFORCED POLYPROPYLENE

INTRODUCTION

By using coupling agent: PP, grafted with maleic anhydride, we can improve mechanical properties of composites with PP and short-chopped glass fibers.

MATERIALS USED

PP matrix: Resinex 2004 RXP PP Homopolymer

Glass fibers: ThermoFlow 601

Coupling agents (from left to right):

- Bondyram 1001
- Exxelor 1020 PO
- Scona TSPP 10213 GB
- GRAFTABOND PPH-MAH 70025 CAF

Prepared Mixtures were all with:

20% Glass Fibers

1% coupling agent
Material Report

SAMPLE TESTING AND PREPARATION

Samples were prepared and tested (Pictures from left to right):

- Twin screw extrusion of PP with GF
- Injection molding of specimen for mechanical tests
- Tensile test
- Charpy Impact Test

RESULTS

Tensile tests were done in A1 specimen, in accordance with ISO 527.
Charpy Impact Strength was done on 1eA specimen (Notch type A, Edgewise), in accordance with ISO 179.

Material Report

Because of crystallization properties of PP, we examined how tensile properties change over time. We measured tensile properties of prepared composites on the day they were injection molded and during the 6 days after that.

![Tensile Stress Increase over Time](image)

### CONCLUSIONS

- When using coupling agents, tensile properties and Charpy impact strength all increase considerably.
- Measured properties are highest with GRAFTABOND PPH-MAH 70025 CAF, with Scona TSPP 10213 GB, and Exxelor PO 1020 not far behind. Bondyram 1001 has the worst performance, but still better than no coupling agent.
- Due to the crystallization of PP, tensile properties continue to increase after preparing the composites.
- GRAFTABOND PPH-MAH 70025 CAF offers the best color and properties together, and it is made in a one-step process with extrusion only. (granules can be provided with underwater pelletizing.)
