

## STABILITY OF GRAFTED MALEIC ANHYDRIDE IN PP-g-MAH

### INTRODUCTION

The aim of this test was, to show the stability of grafted maleic anhydride (MAH), when exposed to different conditions.

When polymers, grafted with MAH are exposed to water/moisture, the anhydride group slowly converts to maleic acid, reducing the effectiveness of MAH by around 5 times.

### MATERIALS USED

We tested and compared the stability between these two materials:

- Fusabond P353 – Polypropylene Copolymer, grafted with MAH  
Produced on: 24.10.2018  
Stored in 20 kg LDPE bag
- GRAFTABOND PPH-MAH 70025 CA – Polypropylene Homopolymer, grafted with MAH  
Produced on: 20.8.2018  
Stored in 20 kg LDPE bag

### TESTS PERFORMED

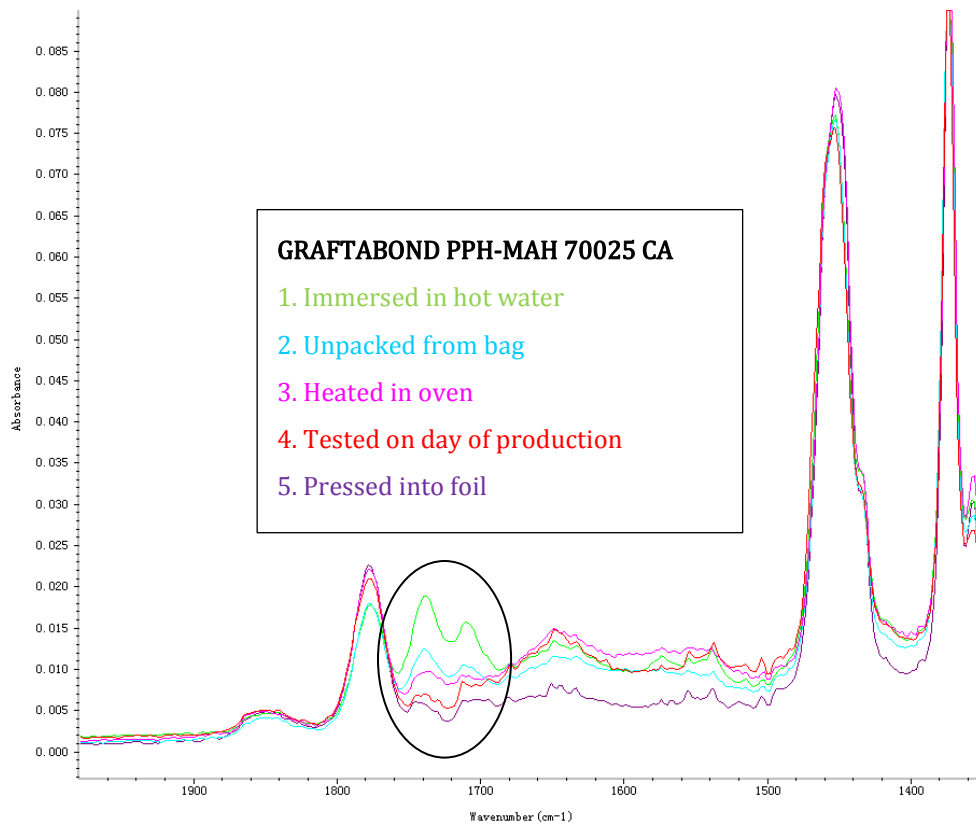

We tested the materials after the following conditions:

- After being unpacked from bags
- Immersed in water at 50°C for 1 hour
- Heated in an oven at 80°C for 3 hours
- Pressed into a foil at 200°C for 10 seconds

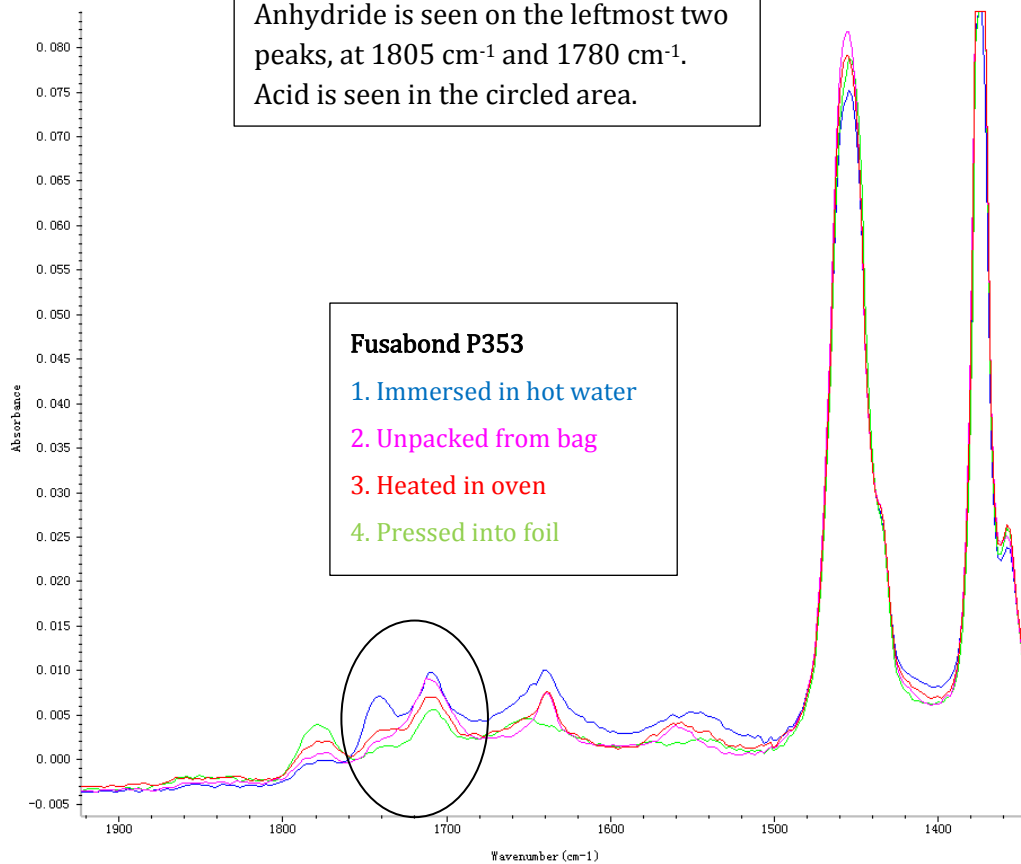

\*GRAFTABOND PPH-MAH 70025 CA spectra was also compared to the day it was produced

Percentage of anhydride and acid content was determined by FTIR spectroscopy.

## RESULTS

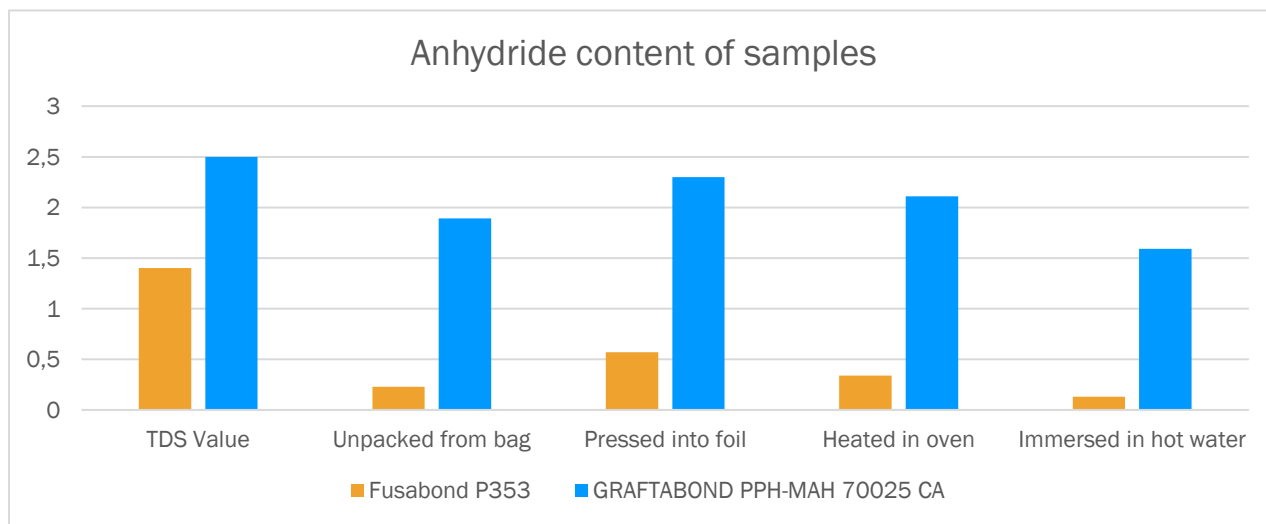

Anhydride is seen on the leftmost two peaks, at 1805 cm<sup>-1</sup> and 1780 cm<sup>-1</sup>.  
Acid is seen in the circled area.

# Stability Test

We calculated the percentage of anhydride, by using the area of peaks at 1850 cm<sup>-1</sup> and 1780 cm<sup>-1</sup>.

Sample State	Anhydride Content [%]	
	<i>GRAFTABOND</i>	<i>FUSABOND</i>
Datasheet Value	≈2,5	1,4
Unpacked from bag	1,89	0,23
Pressed into foil	2,30	0,57
Heated in oven for 3 hours	2,11	0,34
Immersed in hot water for 1 hour	1,59	0,13

## CONCLUSIONS

- When left unopened for longer time, the anhydride of MAH converts to acid, reducing the effectiveness of the additive
- This process is fastest when the material is exposed to water/moisture and heat
- Acid can be converted back to anhydride, by applying heat
- As seen from the spectra, Fusabond P353 always has some acid present, while GRAFTABOND PPH-MAH 70025 CA can convert almost fully to anhydride

Both materials from bag:

- Fusabond P353 retains 16% of MAH in anhydride
- GRAFTABOND PPH-MAH 70025 CA retains 76% of MAH in anhydride

Pressed into foil:

- Fusabond P353 converts 43% of acid to anhydride
- GRAFTABOND PPH-MAH 70025 CA converts 92% of acid to anhydride
